

Visual Network Analysis from the comfort of your Jupyter notebook

Guillaume Plique, médialab SciencesPo

Jupytercon 2023

Who am I?

A **research engineer** working for SciencesPo's médialab.

A **social sciences** laboratory founded by Bruno Latour 10 years ago.

We intend to mix:

- Social sciences
- Design
- Engineering

What is a graph/network

Nodes/vertices, edges/links and the attached metadata.

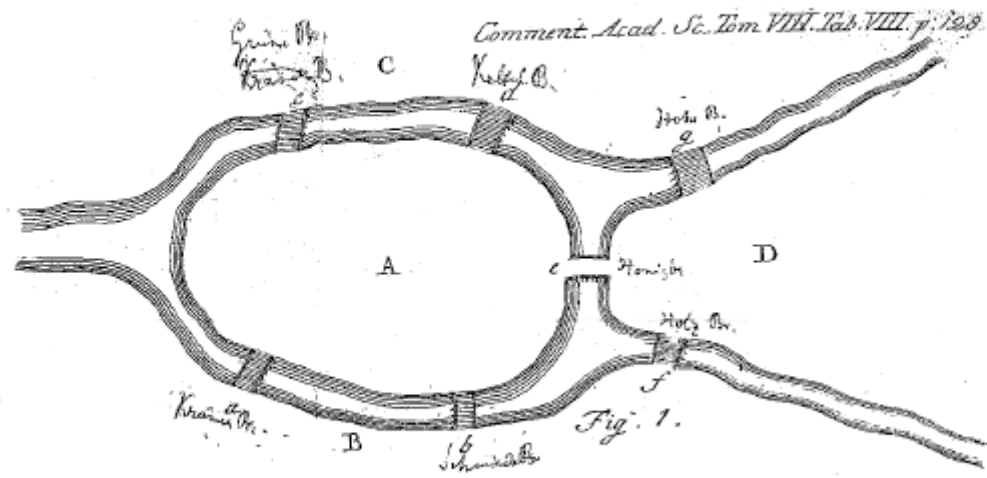

Visual Network Analysis

Prelude: a statistical approach to graphs

- Diameter
- Density
- Degree distribution
- Shortest paths
- Centrality
- Eigenvalues
- Linear algebra (a graph is a matrix, a matrix is a graph)
- Laplacian matrix
- Pagerank
- Amphibolic metempsychosis of the Eulerian principles
- etc.

Should we try vizualizing graphs instead?

Should we try vizualizing graphs instead?

Visual Network Analysis in Social Sciences

Moreno's sociograms

id	Student	First choice	Second choice
1	Amélie	4	3
2	Jean	1	3
3	Kareem	2	26
4	Lydia	45	12
5	Michael	7	28
6	Guillaume	18	3
...

Moreno's sociograms

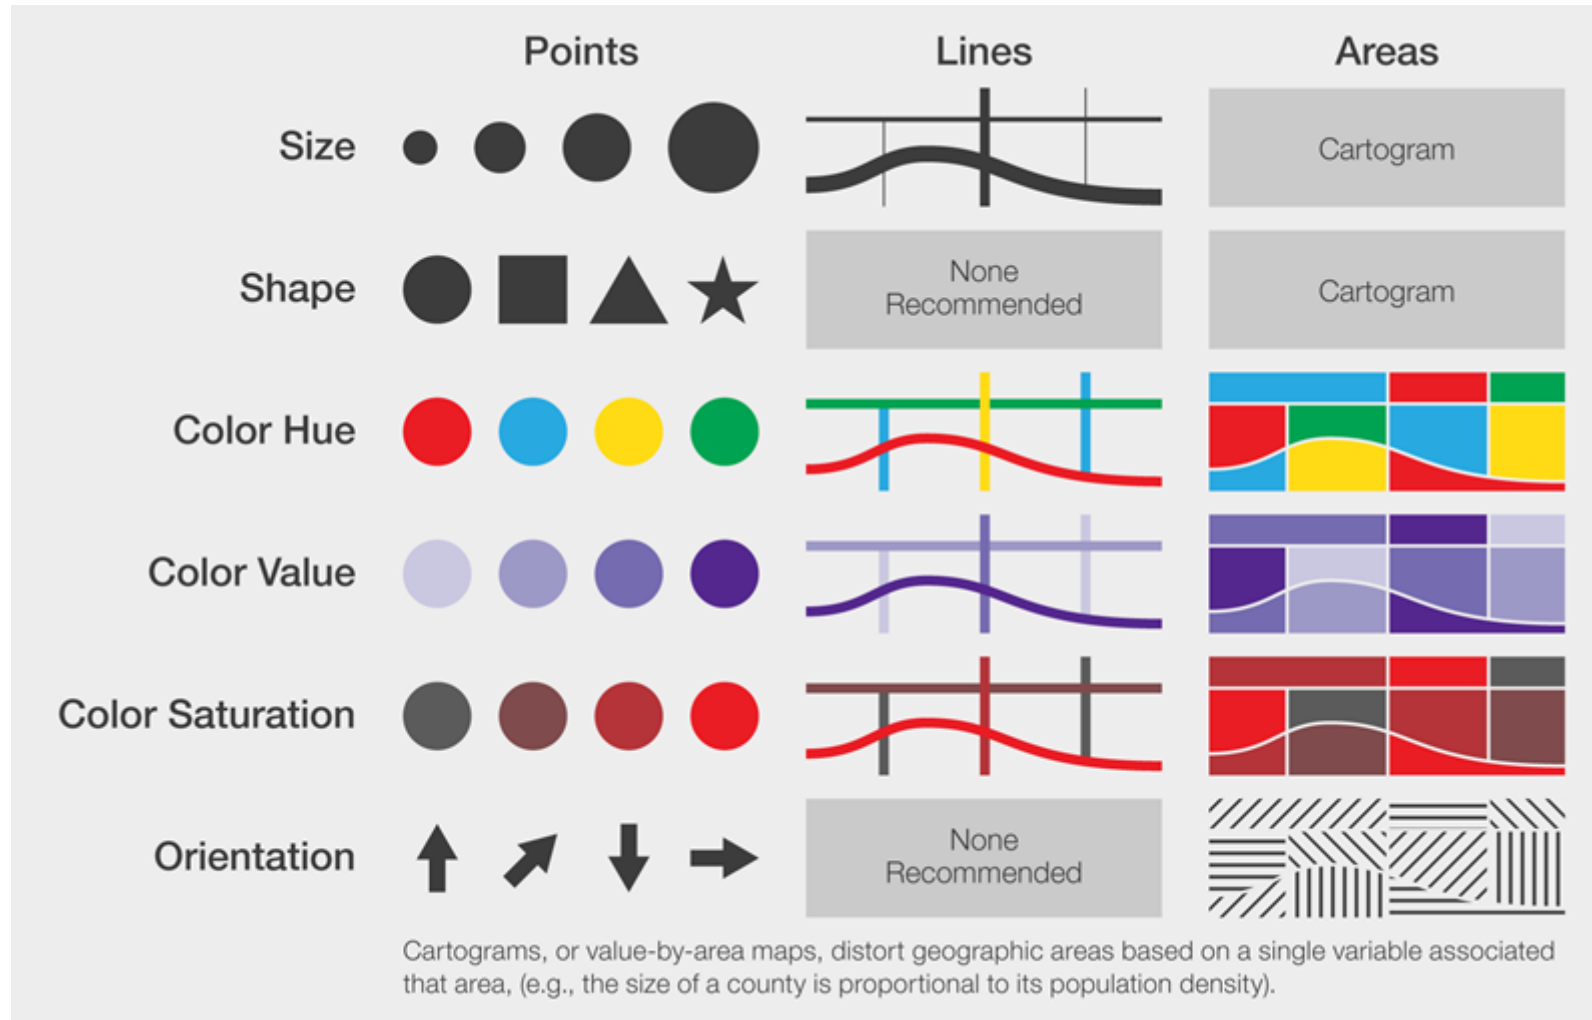

Sociogramme d'une classe d'élèves de 11-12 ans
(critère : s'asseoir à côté des élèves choisis – 2 choix au maximum)

Les lignes barrées indiquent les choix réciproques.

Source : Moreno [1934, annexes, planche XII].

Bertin's visual variables

Fast forward: community detection, spatial layout etc.

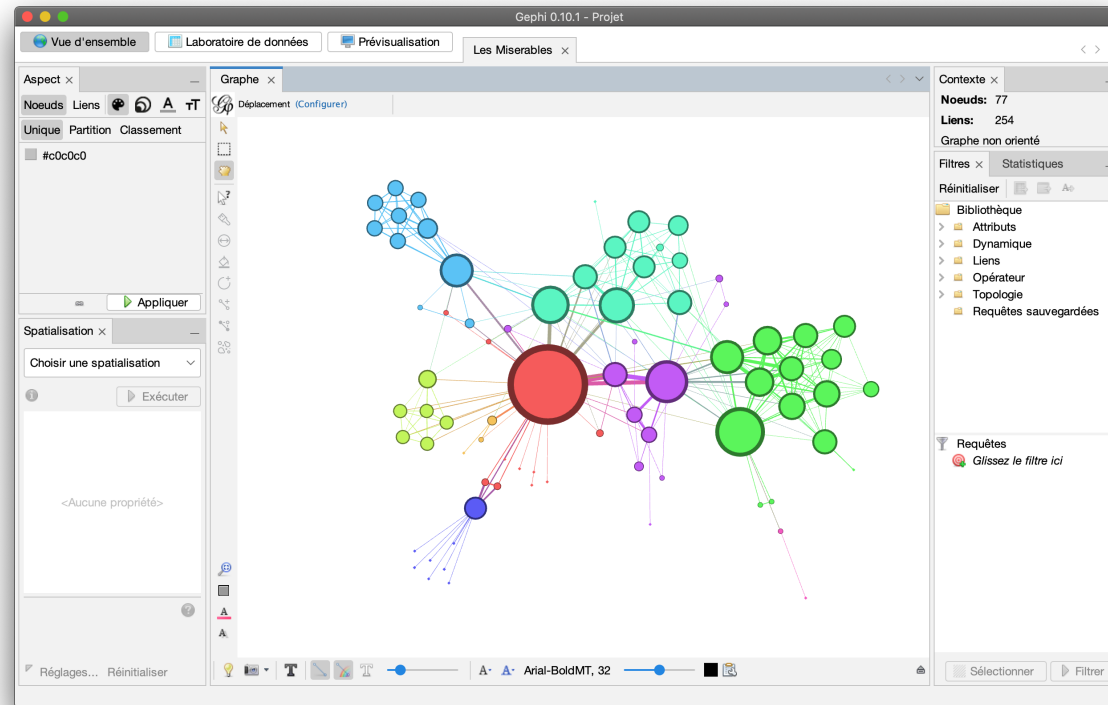

Visual Network Analysis on desktop and on the web

Gephi

A cartography of Wikipedia pages around data visualization

2085 nodes , 5409 edges

Search in nodes...

Description

This map represents a network of Wikipedia articles around the topic of "Data visualisation". Each node represents an article, and each edge a "See also" link.

The seed articles were selected by hand by the Sciences-Po médialab team, and the network was crawled using Seealso, and then cleaned and enriched manually. This makes the dataset creditable to both the médialab team and Wikipedia editors.

This web application has been developed by QuestWare, using react and sigma.js. You can read the source code on GitHub.

Nodes sizes are related to their betweenness centrality. More central nodes (ie. bigger nodes) are important crossing points in the network. Finally, You can click a node to open the related Wikipedia article.

You are currently using a **local file**, that only **you** can access.
To be able to share your visualizations online, you need to first **publish your graph file online**.

[Publish the graph online](#)

⚙️ Graph visualization edition

Before sharing your graph online, you can first select various options on how users will **read and interrogate** this graph.

Your choices in this panel will impact the next white panel, which is the interface your users will have access to.

Which fields should be actionable?

▼ Filter

🎨 Colors

📏 Sizes

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	modularity_class as quantitative values
<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	modularity_class as qualitative values
<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Degree
	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Allow using default graph file colors and/or sizes

Which node information should show up on hovered nodes?

Designing an app for us, social sciences data engineers

Nansi

Two conflicting objectives:

1. A better tool for teaching students
2. Suiting our own data processing/exploration/analysis process

It was *doomed* from the start.

The iterative process

**Why don't we perform Visual Network Analysis directly
in a Jupyter notebook then?**

Introducing ipysigma

```
pip install jupyterlab  
pip install networkx # or igraph  
pip install ipysigma
```

(Hopefully working) Demo time!

Small multiples

```
[1]: import networkx as nx
    from ipysigma import SigmaGrid

[2]: g = nx.read_gexf('./data/rio.gexf')

[ ]: SigmaGrid(g, height=400, hide_search=True, views=[{'node_color': 'Language'}, {}])
```

1

Static embeds

Future directions

- Specialized representations such as:
 - Temporal graphs
 - Bipartite graphs
 - etc.
- Better support for various incarnations of Jupyter:
 - notebook
 - lab
 - colab
 - vscode
 - etc.

Difficulties of developing custom widgets

- The documentation is a bit all around the place
- A lot of different version of `ipywidgets` etc. have to coexist
- Can be tedious to switch from the python/javascript contexts
- A lot of trial and error
- Annoying warnings in the console I cannot find a way to suppress :(

Thank you for listening!
